

# Review of last week's content

- What is an array?
- What are the main differences between an array and a string?
- Comment the C code to explain what is happening.

# Learning Outcomes

At the end of this session, you should be able to:

- Explain what a pointer is,
- Use pointers in simple C programs
- Use pointers with arrays and strings

# What is a Pointer?

- A pointer is a variable containing the address (in memory) of a variable, i.e. a pointer holds the memory location where a variable is stored.
- A pointer is declared to point to a particular type of variable. A declaration of a pointer gives the type and the variable name preceded by an '\*'.
- Examples:

`int *ptrA;      // ptrA is a pointer to an int variable`

`char *ptrB;    // ptrB is a pointer to a char variable`

`float *ptrC;   // ptrC is a pointer to a float variable`

# Working with Pointer Variables

```
int *ptrA;    /* ptrA is a pointer to an int variable */
```

```
int A;
```

...would result in

ptrA

undefined

We don't yet  
know where  
ptrA points.

The names A and ptrA imply that we want ptrA to point to A, but we need to explicitly tell the C compiler this.

The & address operator is used to get the address of A. We can then set ptrA equal to the address of A:

```
ptrA = &A;
```

# Using Pointers

```
int a=1;  
int *ptrA;  
ptrA = &a;
```

ptrA = 100

a

Memory

1

100

To get or set the contents of the memory location which a pointer points to, use the dereferencing operator `*`.

```
printf("Element of variable a is %d\n", *ptrA);
```

```
*ptrA = 25; /* sets the contents at memory location ptrA to 25 */
```

```
int B = *ptrA; /* the integers A and B now both equal 25 */
```

# Working with Pointer Variables

Notice that:

- in a declaration, \* is used to declare a pointer (eg, `int *ptrA`),
- in an assignment statement, \* is used to dereference a pointer (`*ptrA = 25`)
  - Dereference means to get the contents of the memory location.

# Example: Using Pointers

```
int a=1;  
int *ptrA;  
ptrA = &a;
```

```
float b=3.5;
```

```
//Add your code for pointer ptrB
```

```
char c='!';
```

```
//Add your code for pointer ptrB
```

a

Memory

100

b

6000

c

8000

Dereferencing: use

`*ptrA, *ptrB, *ptrC.`

What are ptrA, \*ptrA, ptrB, \*ptrB, ptrC, \*ptrC?

# Solution: Using Pointers

```
int a=1;  
int *ptrA;  
ptrA = &a;
```

```
float b=3.5;  
float *ptrB;  
ptrB = &b;
```

```
char c='!';  
char *ptrC;  
ptrC = &c;
```

|             | a   | Memory |
|-------------|-----|--------|
| ptrA = 100  | 1   | 100    |
| ptrB = 6000 | 3.5 | 6000   |
| ptrC = 8000 | !   | 8000   |

Dereferencing: use  
`*ptrA, *ptrB, *ptrC.`

`*ptrA = 1, *ptrB=3.5, *ptrC='!'`

# Example: Using Pointers

```
#include <stdio.h>
```

```
main() {
```

```
    char c = 'A';    /* from the ASCII table, this is 41 hex. */
```

```
    char *ptrC;
```

```
    ptrC = &c;
```

```
    printf("Element is %c\n", c);
```

```
    printf("Address is %x\n", ptrC);
```

```
    printf("Using pointers:\n");
```

```
    printf("Element is %c and in hex it is %x\n", *ptrC,  
                                                  *ptrC);
```

```
}
```

# Example

X      **Memory**

0.0      100

```
float *p_X, X=0.0;
```

```
p_X=&X;
```

p\_X = 100

```
*p_X=X+5;
```

```
printf("%.2f\n",X);
```

\*p\_X      **Memory**

5.0      p\_X

What would be printed?

5.00

# Working with Pointer Variables

- When would you want to use pointers to access memory locations, rather than manipulating variables directly?
  - Mainly used when passing parameters to functions.
  - Can be used as part of dynamic allocation of memory.
  - Can be used as an alternative way of accessing array contents.
- Pointer variables can be used with `+`, `-`, `++`, `--` (that is, you can add to, subtract from and increment and decrement an address)

# Pointers and Arrays

- An array is stored in a block of contiguous memory locations.
- **The array name on its own is a pointer to the first location in the array (eg,  $A[0]$ ).** This can be used in assignment statements iff it is assigned to a pointer variable of the same base type.

# Using Pointers with Arrays

```
int a[]={2,4,6,8,10};  
int *ptrA;  
ptrA = a;
```

|              | a  | Memory |
|--------------|----|--------|
| ptrA = 100   | 2  | 100    |
| ptrA+1 = 104 | 4  | 104    |
| ptrA+2 = 108 | 6  | 108    |
| ptrA+3 = 112 | 8  | 112    |
| ptrA+4 = 116 | 10 | 116    |

Dereferencing: use `*ptr`.

e.g.

```
for (i=0; i<5; i++) {  
    printf("The elements of the array are  
    %d\n", *(ptrA+i)); }
```

# Example

- What gets printed to the screen?

```
int array[]={0,2,4,8,16}, *pA, *pB;
```

```
pA=array;
```

```
pB=array+3;
```

```
printf("array: %d %d %d %d %d; *pA %d,  
*pB %d", array[0], array[1],  
array[2], array[3], array[4], *pA,  
*pB) ;
```

# Using Pointers with Strings

```
char s[6]="Hello";  
int *ptrS;  
ptrS = s;
```

ptrS = 100

ptrS+1 = 104

ptrS+2 = 108

ptrS+3 = 112

ptrS+4 = 116

s

Memory

|   |     |
|---|-----|
| H | 100 |
| e | 104 |
| l | 108 |
| l | 112 |
| o | 116 |

e.g.

```
printf("The string is %s", ptrS);
```

The implementation of printf() sees the "%s", assumes that the corresponding argument is a pointer to char, and uses that pointer to traverse the string and print it.

# What Would be Printed?

```
char string[25], *ps;
```

```
scanf("%s", string);  
/* say you enter ABCD */
```

```
ps=string;
```

```
printf("%c\n", *(ps+2));
```

s

Memory

|   |
|---|
| A |
| B |
| C |
| D |

100

ps = 100

Memory

\*ps

\*(ps+1)

\*(ps+2)

\*(ps+3)

|   |
|---|
| A |
| B |
| C |
| D |

ps

ps+1

ps+2

ps+3

# Example Program with Pointers

```
#include <stdio.h>
```

```
main()
```

```
{
```

```
    int list1[10]={10,20,30,40,50,60,70,80,90,100};
```

```
    char list2[10];
```

```
    int *plist1;
```

```
    char *plist2;
```

```
    int i;
```

```
    plist1=list1;
```

```
    plist2=list2;
```

```
    scanf("%s",list2); //assume you enter abcdefghij
```

```
    for(i=0; i<10; i++)
```

```
    {
```

```
        printf("%c %d\n",*(plist2+i), *(plist1+i));
```

```
    }
```

```
    printf("%s\n", plist2);
```

```
}
```

# Learning Outcomes

At the end of this session, you should be able to:

- Explain what a pointer is,
  - A pointer is a variable containing the address (in memory) of a variable.
- Use pointers in simple C programs

```
int a=1;  
int *ptrA;  
ptrA = &a;
```

dereferencing  
operator:  
`*ptrA = 2;`

- Use pointers with arrays and strings

```
int a[]={2,4,6,8,10};  
int *ptrA;  
ptrA = a;
```

```
char s[6]="Hello";  
char *ptrS;  
ptrS = s;
```
